题目链接: [Codeforces 1228E \(https://codeforces.com/contest/1228/problem/E\)](https://codeforces.com/contest/1228/problem/E)

你有一个  $n \times n$  的网格和一个整数  $k$ , 在每个格子中都填入一个整数, 满足如下条件:

- 所有格子中的整数都介于 1 到  $k$  之间。
- 第  $i$  行的最小值为 1 ( $1 \leq i \leq n$ )。
- 第  $j$  列的最小值为 1 ( $1 \leq j \leq n$ )。

请求出填数的方案数, 答案对  $10^9 + 7$  取模。

数据范围:  $1 \leq n \leq 250$ ,  $1 \leq k \leq 10^9$ 。

## Solution

### 算法 1

设  $f(i, j)$  表示已经填完了前  $i$  行, 有  $j$  列已经包含 1 了。枚举上一行填了  $k$  个 1 则有:

- $f(0, 0) = 1$ 。
- $f(i, j) = f(i - 1, j) \cdot (k^j - (k - 1)^j) \cdot (k - 1)^{n-j}$ , 其中第二项表示这  $j$  个位置至少需要有一个 1, 则可以用全集减去补集表示。
- $f(i, j) = f(i - 1, k) \cdot \binom{n-k}{j-k} \cdot (k - 1)^{n-j}$  其中  $0 \leq k < j$ 。

时间复杂度:  $\mathcal{O}(n^3)$ 。

## 算法 2

考虑容斥。我们枚举至少  $i$  行和  $j$  列没有 1。那么答案为:

$$\sum_{i=0}^n \sum_{j=0}^n (-1)^{i+j} \binom{n}{i} \cdot \binom{n}{j} \cdot (k-1)^{n(i+j)-ij} \cdot k^{(n-i)(n-j)} \quad (1)$$

时间复杂度:  $\mathcal{O}(n^2) \sim \mathcal{O}(n^2 \log n)$ 。

## 算法 3

我们对 (1) 进行化简, 具体方法为: 对第二重  $j$  求和根据二项式定理展开, 最终得到的式子为:

$$\sum_{i=0}^n (-1)^i \cdot \binom{n}{i} \cdot (k^{n-i} \cdot (k-1)^i - (k-1)^n)^n$$

时间复杂度:  $\mathcal{O}(n \log n)$ 。

## Code

### 算法 1

```
1 #include <cstdio>
2
3 const int N = 250;
4 const int MOD = 1e9 + 7;
5
6 int n, k, p[N + 5], q[N + 5], c[N + 5][N + 5], f[N + 5][N + 5];
7
8 void add(int &x, int y) {
9     (x += y) >= MOD && (x -= MOD);
10 }
11 void sub(int &x, int y) {
12     (x -= y) < 0 && (x += MOD);
13 }
14 int add(int x) {
15     return x >= MOD ? x - MOD : x;
16 }
17 int sub(int x) {
18     return x < 0 ? x + MOD : x;
19 }
```

## 算法 2

```
1 #include <cstdio>
2
3 const int N = 250;
4 const int MOD = 1e9 + 7;
5
6 int n, k, fac[N + 5], ifac[N + 5], pw1[N * N + 5], pw2[N * N + 5];
7
8 void add(int &x, int y) {
9     (x += y) >= MOD && (x -= MOD);
10 }
11 void sub(int &x, int y) {
12     (x -= y) < 0 && (x += MOD);
13 }
14 int pow(int x, int k) {
15     int ans = 1;
16     for (; k > 0; k >>= 1, x = 1LL * x * x % MOD) {
17         if ((k & 1) == 1) ans = 1LL * ans * x % MOD;
18     }
19     return ans;
```

## 算法 3

```

1 #include <cstdio>
2
3 const int N = 250;
4 const int MOD = 1e9 + 7;
5
6 int n, k, fac[N + 5], ifac[N + 5], p[N + 5], q[N + 5];
7
8 void add(int &x, int y) {
9     (x += y) >= MOD && (x -= MOD);
10 }
11 void sub(int &x, int y) {
12     (x -= y) < 0 && (x += MOD);
13 }
14 int mod(int x) {
15     return x < 0 ? x + MOD : x >= MOD ? x - MOD : x;
16 }
17 int pow(int x, int k) {
18     int ans = 1;
19     for (; k > 0; k >>= 1, x = 1LL * x * x % MOD) {

```
